Amendments to the Claims:

The following claims will replace all prior versions of the claims in this application (in the unlikely event that no claims follow herein, the previously pending claims will remain):

- 1. (Cancelled)
- 2. (Currently Amended) <u>A method of manufacturing a semiconductor device</u>, comprising:

forming a gate on a predetermined area of a semiconductor substrate, forming spacers on side walls thereof, and then forming a junction area in a predetermined area of the semiconductor substrate;

forming a cobalt film and a buffer layer on the whole structure;

forming a cobalt mono-silicide film on the gate and the junction area, by performing a first RTP process;

making a surface of the cobalt mono-silicide film amorphous to form an amorphous cobalt silicide film, by performing a carbon ion implanting process; and

forming a cobalt di-silicide film, by removing the non-reacting cobalt film and the buffer layer and then performing a second RTP process,

A method of manufacturing a semiconductor device according to claim 1, wherein the cobalt film is formed to have a thickness of 70Å to 150Å, by keeping a reacting furnace, which initially maintains a pressure of 1×10⁻⁷ to 1×10⁻⁸ Torr, in 1×10⁻² to 1×10⁻⁴ Torr and at from a room temperature to a temperature of 550°C, and by using any one of a DC sputtering method, an RF sputtering method and a CVD method.

- 3. (Currently Amended) A method of manufacturing a semiconductor device according to claim 4 2, wherein the buffer layer is a TiN film.
- 4. (Previously Presented) A method of manufacturing a semiconductor device according to claim 3, wherein the TiN film is formed to have a thickness of 100Å to 500Å, by keeping a reacting furnace, which initially maintains a pressure of 1×10⁻⁷ to 1×10⁻⁸ Torr, in 1×10² to 1×10⁴ Torr and at from a room temperature to a temperature of 400°C, and by using any one of a DC sputtering method, an RF sputtering method and a CVD method.

Application No. <u>10/731,481</u> Amendment dated July 12, 2005 Page 3

- 5. (Currently Amended) A method of manufacturing a semiconductor device according to claim 4 2, wherein the first RTP process is performed at a temperature of 430°C to 530°C for a time of 10 to 60 seconds, by introducing nitrogen gas, argon gas, helium gas and hydrogen gas at a flow rate of 10 to 1000sccm, respectively.
- 6. (Currently Amended) A method of manufacturing a semiconductor device according to claim 4 2, wherein the carbon ion implanting process is performed up to a depth of 50Å to 1000Å with an energy of 10 to 100keV and a dose of 1×10¹⁴ to 1×10¹⁶ atoms/cm².
- 7. (Currently Amended) A method of manufacturing a semiconductor device according to claim 4 2, wherein the second RTP process is performed at a temperature of 650°C to 800°C for a time of 5 to 30 seconds, by introducing nitrogen gas, argon gas, helium gas and hydrogen gas at a flow rate of 10 to 1000sccm, respectively.
 - 8. (Cancelled)
- 9. (Previously Presented) A method of manufacturing a semiconductor device, comprising the steps of:

forming a gate on a predetermined area of a semiconductor substrate, forming spacers on side walls thereof, and then forming a junction area in a predetermined area of the semiconductor substrate;

forming a cobalt film and a buffer layer on the whole structure;

forming a cobalt mono-silicide film on the gate and the junction area, by performing a first RTP process;

making a surface of the cobalt mono-silicide film amorphous to form an amorphous cobalt silicide film, by performing a carbon ion implanting process; and

forming a cobalt di-silicide film, by removing the non-reacting cobalt film and the buffer layer and then performing a second RTP process,

wherein the carbon ion implanting process is performed up to a depth of 50Å to 1000Å with an energy of 10 to 100keV and a dose of 1×10^{14} to 1×10^{16} atoms/cm².

Application No. <u>10/731,481</u> Amendment dated July 12, 2005 Page 4

- 10. (Previously Presented) A method of manufacturing a semiconductor device according to claim 9, wherein the cobalt film is formed to have a thickness of 70Å to 150Å, by keeping a reacting furnace, which initially maintains a pressure of 1×10⁻⁷ to 1×10⁻⁸ Torr, in 1×10⁻² to 1×10⁻⁴ Torr and at from a room temperature to a temperature of 550°C, and by using any one of a DC sputtering method, an RF sputtering method and a CVD method.
- 11. (Previously Presented) A method of manufacturing a semiconductor device according to claim 9, wherein the buffer layer is a TiN film.
- 12. (Previously Presented) A method of manufacturing a semiconductor device according to claim 11, wherein the TiN film is formed to have a thickness of 100Å to 500Å, by keeping a reacting furnace, which initially maintains a pressure of 1×10⁻⁷ to 1×10⁻⁸ Torr, in 1×10² to 1×10⁴ Torr and at from a room temperature to a temperature of 400°C, and by using any one of a DC sputtering method, an RF sputtering method and a CVD method.
- 13. (Previously Presented) A method of manufacturing a semiconductor device according to claim 9, wherein the first RTP process is performed at a temperature of 430°C to 530°C for a time of 10 to 60 seconds, by introducing nitrogen gas, argon gas, helium gas and hydrogen gas at a flow rate of 10 to 1000sccm, respectively.
- 14. (Previously Presented) A method of manufacturing a semiconductor device according to claim 9, wherein the second RTP process is performed at a temperature of 650°C to 800°C for a time of 5 to 30 seconds, by introducing nitrogen gas, argon gas, helium gas and hydrogen gas at a flow rate of 10 to 1000sccm, respectively.
- 15. (Previously Presented) A method of manufacturing a semiconductor device, comprising the steps of:

forming a gate on a predetermined area of a semiconductor substrate, forming spacers on side walls thereof, and then forming a junction area in a predetermined area of the semiconductor substrate;

forming an insulating film on the whole structure and then removing the insulating film on an area in which a silicide film should be formed;

forming a cobalt film and a TiN film on the whole structure;

Application No. <u>10/731,481</u> Amendment dated July 12, 2005 Page 5

making the cobalt film react with the gate and the junction area from which the insulating film is removed and exposed, to form a cobalt mono-silicide film, by performing a first RTP process;

making a surface of the cobalt mono-silicide film amorphous to form an amorphous cobalt silicide film, by performing a carbon ion implanting process; and

forming a cobalt di-silicide film, by removing the non-reacting cobalt film and the TiN film and then performing a second RTP process,

wherein the carbon ion implanting process is performed up to a depth of 50Å to 1000Å with an energy of 10 to 100keV and a dose of 1×10^{14} to 1×10^{16} atoms/cm².

- 16. (Previously Presented) A method of manufacturing a semiconductor device according to claim 15, wherein the cobalt film is formed to have a thickness of 70Å to 150Å, by keeping a reacting furnace, which initially maintains a pressure of 1×10⁻⁷ to 1×10⁻⁸ Torr, in 1×10⁻² to 1×10⁻⁴ Torr and at from a room temperature to a temperature of 550°C, and by using any one of a DC sputtering method, an RF sputtering method and a CVD method.
- 17. (Previously Presented) A method of manufacturing a semiconductor device according to claim 15, wherein the TiN film is formed to have a thickness of 100Å to 500Å, by keeping a reacting furnace, which initially maintains a pressure of 1×10⁻⁷ to 1×10⁻⁸ Torr, in 1×10² to 1×10⁴ Torr and at from a room temperature to a temperature of 400°C, and by using any one of a DC sputtering method, an RF sputtering method and a CVD method.
- 18. (Previously Presented) A method of manufacturing a semiconductor device according to claim 15, wherein the first RTP process is performed at a temperature of 430°C to 530°C for a time of 10 to 60 seconds, by introducing nitrogen gas, argon gas, helium gas and hydrogen gas at a flow rate of 10 to 1000sccm, respectively.
- 19. (Previously Presented) A method of manufacturing a semiconductor device according to claim 15, wherein the second RTP process is performed at a temperature of 650°C to 800°C for a time of 5 to 30 seconds, by introducing nitrogen gas, argon gas, helium gas and hydrogen gas at a flow rate of 10 to 1000sccm, respectively.
